

NEEDLE ROLLER CAGES FOR GENERAL USAGE

Structure and Features

IKO Needle Roller Cages for General Usage are bearings which display excellent rotational performance. Needle rollers with extremely small dimensional variations in diameter are incorporated and retained in their specially shaped cages with high rigidity and accuracy, which precisely guide the needle rollers.

When combined with shafts and housing bores that are heat treated and accurately ground as raceway surfaces, Needle Roller Cages for General Usage are particularly useful in small spaces.

In addition, since they are lightweight and have high rigidity as well as a large lubricant holding capacity, they can withstand severe operating conditions such as high speed rotation and shock loads, and they are used in a wide range of applications.

Structures of Needle Roller Cages for General Usage

Types

Needle Roller Cages for General Usage are available in two types, with single row needle rollers and double row needle rollers.

For applications such as crank shafts where these bearings are difficult to install, it is also possible to make split type bearings.

If such bearings are required, please contact **IKO**. For Needle Roller Cages for Engine Connecting Rods (KT...EG and KTV...EG), see page C17.

Identification Number

The identification number of Needle Roller Cages for General Usage consists of a model code, dimensions and any supplemental codes. The arrangement examples are shown below.

Examples of identification number

Example 1

Model code	Dimensions	Supplemental code
KT	15 20 10	C3

- Type of bearing: KT
- Roller set bore diameter (15mm): 15
- Roller set outside diameter (20mm): 20
- Cage width (10mm): 10
- Tolerance of mean value of roller dia. (Refer to Table 1.): C3

Example 2

Model code	Dimensions	Supplemental code
KTW	24 28 34	B4

- Type of bearing: KTW
- Roller set bore diameter (24mm): 24
- Roller set outside diameter (28mm): 28
- Cage width (34mm): 34
- Tolerance of mean value of roller dia. (Refer to Table 1.): B4

Accuracy

The diameter tolerances of needle rollers of Needle Roller Cages for General Usage are classified by classification symbols shown in Table 1. If a classification symbol is not indicated in an identification number, the classification symbol "C3" is applied.

When two or more bearings are used in tandem arrangement on the same shaft, it is necessary to select bearings of the same classification symbol to obtain an even load distribution.

The tolerance of the cage width B_c is $-0.20 \sim -0.55$ mm.

Table 1 Diameter tolerances of needle rollers unit: μ m

Classification symbol	Tolerance of mean value of needle roller diameter
C 3	0 ~ -3
B 2	0 ~ -2
B 4	-2 ~ -4
B 6	-4 ~ -6
B 8	-6 ~ -8
B10	-8 ~ -10

Fit

Radial clearances of Needle Roller Cages for General Usage are determined by the dimensional accuracy of the raceways and needle rollers. Table 2 shows the recommended fits for the operating conditions.

Table 2 Recommended fits of shaft to the housing bore diameter G6

Operating conditions	Shaft	
	$F_w \leq 68\text{mm}$	$F_w > 68\text{mm}$
When high operating accuracy is required. When shock loads and oscillating motions are applied.	j5	h5
For general use	h5	g5
When the temperature is high, or mounting errors are large.	g6	f6

Remark When setting the required radial clearance according to the operating conditions, the clearance can easily be obtained by selecting and matching the tolerances of needle rollers, shaft and housing bore. When variation of the clearance does not create any problems, h6 and G7 are used for shaft and housing bore, respectively.

Specifications of shaft and housing

For the raceways, a surface hardness of 58 ~ 64HRC and a surface roughness $0.2\mu\text{m}R_a$ or less are desirable. However, when the operating conditions are not severe, a surface roughness $0.8\mu\text{m}R_a$ or less can be used.

When the surface hardness is low, it is necessary to correct the load rating by the hardness factor specified on page A20.

Operating temperature range

For synthetic resin cages, "N" is added at the end of the identification number. The operating temperature range for Needle Roller Cages for General Usage is $-20^\circ\text{C} \sim +120^\circ\text{C}$. However, the maximum allowable temperature for synthetic resin cages is $+110^\circ\text{C}$, and when they are continuously operated, it is $+100^\circ\text{C}$.

Mounting

The dimensions related to mounting of Needle Roller Cages for General Usage are shown in Figs. 1 and 2. When mounting Needle Roller Cages for General Usage, they are axially positioned by using, for example, Cir-clips for shaft and housing bore (WR and AR on page L17) as shown in Figs. 3, 4 and 5.

For high rotational speed applications, a heat treated and ground spacer is positioned between the cage and the cir-clip as shown in Fig. 5 so that the cage does not make direct contact with the cir-clip. In this case, the cir-clip is normally mounted on the non-rotating side.

Fig. 3 shows a mounting example in the case of outer ring rotation, and Figs. 4 and 5 show examples in the case of inner ring rotation.

NEEDLE ROLLER CAGES FOR ENGINE CONNECTING RODS

- Needle Roller Cages for Big End
- Needle Roller Cages for Small End

Structure and Features

IKO Needle Roller Cages for Engine Connecting Rods are bearings for use in engine connecting rods. These bearings have superior performance proven in high performance engines of racing motor cycles, and are widely used in small motor vehicles, motor cycles, outboard marines, snow mobiles, high-speed compressors, etc. and also in general-purpose engines. Bearings for engine connecting rods are used under extremely severe and complex operating conditions such as heavy shock loads, high speeds, high temperatures and stringent lubrication. Needle Roller Cages for Engine Connecting Rods are lightweight, and have high load ratings and high rigidity as well as superior wear resistance to withstand these severe conditions.

Types

In Needle Roller Cages for Engine Connecting Rods, the types shown in Table 1 are available.

Table 1 Types

Type	For big end	For small end
Model code	KT···EG	KTV···EG

Structures of Needle Roller Cages for Engine Connecting Rods

KT···EG

KTV···EG

Needle Roller Cages for Big End KT...EG

These roller cages are subjected to acceleration and deceleration during their rotating and epicyclic motion due to crank shaft rotation. To withstand such conditions, they are made of a special alloy and are lightweight with high rigidity.

They are guided on their outer periphery surface with superior lubricating properties.

For the purpose of using them under severe conditions such as high rotational speed and stringent lubrication, bearings plated with non-ferrous metals are also available on request.

High-load capacity and high-rigidity cages to be used for racing motor cycles (See the photo below.), split needle cages for solid (one-piece) type crank-shafts and other special specification cages of various types are also available. Please consult **IKO** when required.

High-load capacity and high-rigidity cage KTZ...EG

Needle Roller Cages for Small End KTV...EG

These roller cages oscillates at high speeds within a limited loading zone under heavy shock loads. Thus, these cages are designed to be lightweight and have high rigidity with a well-balanced structure. In these cages, a number of needle rollers having a small diameter are incorporated to reduce the rolling contact stress in the loading zone.

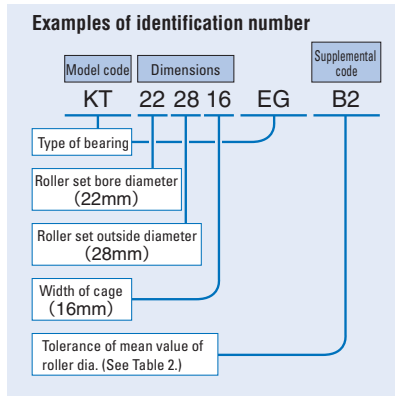

Needle Roller Cages for Small End are classified into two types, the outer surface guide type and the inner surface guide type. This classification is shown in the table of dimensions.

In the outer surface guide type, the cage is guided by the sliding contact between the inner surface of the connecting rod and the outer surface of the cage.

In the inner surface guide type, the cage is guided by the sliding contact between the outer surface of the pin and the inner surface of the cage.

Identification Number

The identification number of Needle Roller Cages for Engine Connecting Rods consists of a model code, dimensions and any supplemental codes as shown below.

Accuracy

The diameter tolerances of needle rollers of Needle Roller Cages for Engine Connecting Rods are classified as shown in Table 2. When the classification symbol is not indicated in the identification number, the classification symbol "B2" is applied.

The tolerance of the cage width B_c is $-0.2 \sim -0.4$ mm. But cages with marks in the B_c column in the dimension tables are manufactured with the following width tolerances.

- : $0 \sim -0.2$ mm
- : $-0.1 \sim -0.3$ mm

Table 2 Tolerances of needle roller diameter unit: μ m

Class	Classification symbol ⁽¹⁾	Tolerance of mean value of roller dia. ⁽²⁾
Standard	B 2	$0 \sim -2$
	B 4	$-2 \sim -4$
Semi-standard	B 6	$-4 \sim -6$
	B 8	$-6 \sim -8$
	B10	$-8 \sim -10$

Notes⁽¹⁾ The classification symbol is indicated at the end of the identification number.

⁽²⁾ Tolerances for circularity are based on JIS B 1506 (Rolling bearings - Rollers).

Clearance

Radial internal clearances are selected according to the type of engine and the operating conditions (rotational speed, load, lubricating conditions, etc.). If a bearing is used with an inadequate clearance, bearing troubles such as seizure, early flaking and noise increase may occur, leading to an engine failure. Therefore, it is necessary to select the clearance carefully according to test results and experience.

Recommended radial internal clearances are shown in Table 3. When operating at high speeds, it is recommended to select the upper limit of the clearance.

Fit

To obtain the recommended clearance shown in Table 3, it is general practice to match a connecting rod, crank pin and piston pin and needle roller cage of suitable tolerances for assembly.

Precautions for Use

When designing a connecting rod, crank pin and piston pin, the following precautions should be taken, because the raceways are subjected to loads under extremely severe conditions.

1 Material

It is recommended to use carburizing steel because the raceways are subjected to fluctuating loads with frequent and heavy shock loads. Generally, chromium molybdenum steel is used. Nickel chromium molybdenum steel is also used.

2 Hardness

The recommended surface hardness of the raceway is 697~800HV (60~64HRC). While the effective hardening depth differs depending on the applications, the general value is 0.6~1.2 mm.

3 Surface roughness

To minimize initial wear and to extend life, it is recommended that the surface roughness of the crank pin and piston pin be $0.1 \mu\text{m}R_a$ or less, and the surface roughness of the connecting rod large end and small end bores be $0.2 \mu\text{m}R_a$ or less.

4 Accuracy

Circularity and cylindricity of connecting rod, piston pin and crank pin are as shown in Table 4.

5 Parallelism and torsional accuracy of connecting rod bores

$L \pm 0.02$ mm and $E \pm 0.02$ mm shown in Fig. 1 indicate the parallelism and torsional accuracy between the big end and small end bores of the connecting rod, respectively. The tolerance range is 0.04 mm or less per 100 mm in case of a general-purpose engine and 0.02 mm or less for a high-speed engine such as a racing motorcycle engine. When these accuracy conditions are not satisfied, the axial forces on the needle roller cage and connecting rod will increase, directly leading to a failure such as seizure. Careful consideration is required.

Over	Incl.		
—	18	$(d_p - 6) \sim d_p$	3 ~ 15
18	30	$(d_p - 8) \sim d_p$	
30	40	$(d_p - 12) \sim d_p$	

Remark d_p is obtained using the following formula for roller pitch circle diameter in millimeters, and changing the unit from millimeters to micrometers.

Roller pitch circle dia. = $\frac{F_w + E_w}{2}$
 Example KT 222814 EG for big end
 Recommended clearance is; $17 \sim 25 \mu\text{m}$

Table 4 Accuracy of connecting rod, piston pin and crank pin unit: μ m

Range of dia. mm		Crank pin diameter d_1 Piston pin diameter d_2		Big end bore D_1 Small end bore D_2
