Clutches and Brakes that Accurately Control a Variety of General Industrial Machinery

Clutches accurately connect and release power by being located between the driver and the load. Brakes are used to slow or stop load inertia and machinery and to hold things in stationary positions. Using these basic operations and combining clutches and brakes enable a variety of applications such as stepped speed-changing mechanisms, switching between forward and reverse operation, positioning/indexing, and inching. Part of their appeal is the simplicity of control and ease of maintenance.

Armature type-1

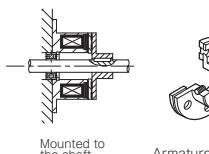

Brake

111-□-1□

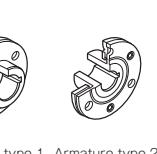

Size Shaft Coupling System (Armature)

Shaft-mounted type

These use axial braking in most cases, the effectiveness of which depends on how efficiently parts are mounted.

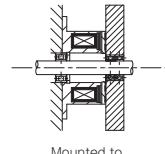

Armature type-1 Armature type-2

Rotor-mounted type

Uses an armature assembly mounted directly to an inertial body not fastened to the shaft that continues to move even after the shaft has stopped.

Mounted to the rotor

Armature type-3

One-touch mounted type

CSZ, BSZ

Designed with the same basic construction as that of the standard type. Comes equipped with a stator armature, eliminating the need for time-consuming gap adjustments. Easy to assemble, guaranteeing dramatic reductions in assembly times.

Electromagnetic-actuated Clutches - Flange-mounted Type

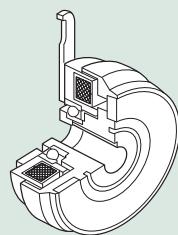

Flange-mounted type

Stator and rotor are combined and directly mounted on stationary parts, such as frames, and fixed in place. These are short in the axial direction and can make effective use of space near windows. Select the armature according to the coupling type used (through-shaft, butt shaft, etc.).

Clutch torque	[N·m]	5 ~ 320
Operating temperature	[°C]	-10 ~ +40
Backlash		Zero

CS

Electromagnetic-actuated Clutches - Bearing-mounted Type

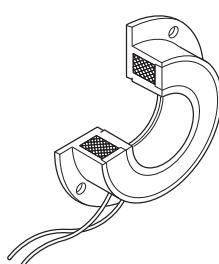

Bearing-mounted type

These integrate the stator and rotor, which are held to the stationary parts of the machine by a drive pin arm; the rotor is locked to the rotation shaft by a key. They are designed to be relatively easy to mount, reducing the processing work required for mounting.

Clutch torque	[N·m]	5 ~ 320
Operating temperature	[°C]	-10 ~ +40
Backlash		Zero

111

Electromagnetic-actuated Brakes

Brakes are used to brake and hold rotating bodies. The flange of the stator is locked securely to a strong stationary part. Select an armature that factors in the mounting space available.

Brake torque	[N·m]	5 ~ 320
Operating temperature	[°C]	-10 ~ +40
Backlash		Zero

CSZ/BSZ

Electromagnetic-actuated Clutches & Brakes - One-touch-mounted Type

CSZ

BSZ

These models adjust the gap to the frictional surface that clutches and brakes require to operate and come pre-assembled. Clutches are simply placed on the shaft and brakes mounted on the flange surface. They do not require gap adjustment or adjustment of concentricity/parallel misalignment, greatly reducing installation work.

Clutch/brake torque	[N·m]	2.4 ~ 10
Operating temperature	[°C]	-10 ~ +40

Mounting Example

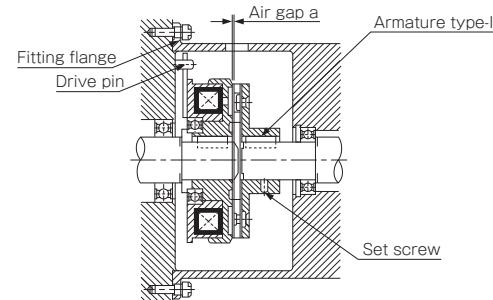

Flange-mounting example with 101

The stator is directly mounted on a stationary part, such as a frame, by a mounting flange, and fixed in place. The rotor is locked to the rotation shaft using a key. The stator and rotor are combined via a narrow air gap that serves as part of the magnetic circuit to form a magnetic pole.

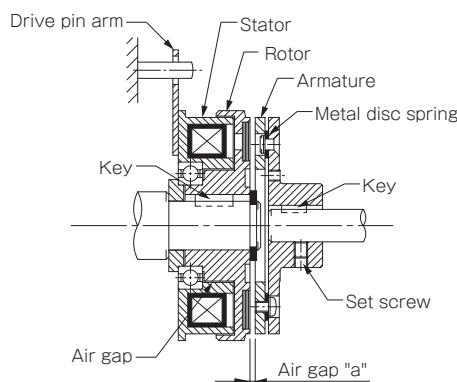

Butt shaft mounting example with CS

In designs that use butt shafts, the two shafts can be reliably centered using fitting flanges, as shown in the figure.

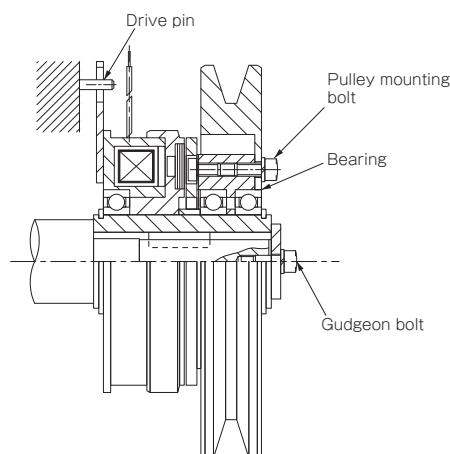

Bearing-mounting example with CS

The stator is integrated with the rotor via a bearing and held to the stationary parts of the machine by a drive pin arm. The rotor is locked to the rotation shaft using a set screw. The stator and rotor form a magnetic pole via the bearing.

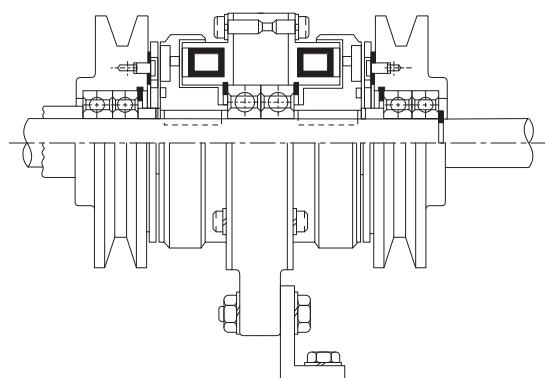

Mounting example with CSZ

Simply insert the shaft in the sleeve and fasten a CSZ on the shaft end and mounting is complete.

Example of combining clutches

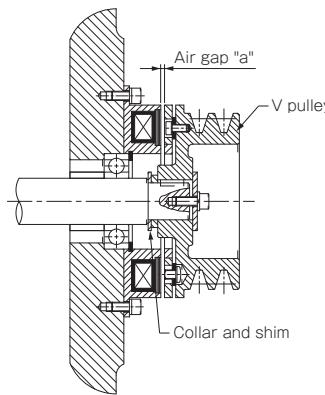

In this example, two clutches are assembled on a through-shaft. This is very effective when controls such as two-step speed changing and forward/reverse operation are needed and space is limited.

Mounting Example

Armature type-3 mounting example with 111

When armature type-3 is directly mounted on the end face of a V pulley, no armature hub is needed, making for a very efficient design. These are optimal when space is limited or when a shaft overhangs from a wall and the overhang load must be kept extremely low.

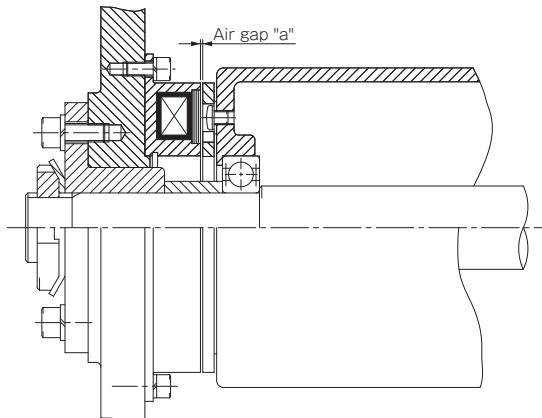

Armature type-3 mounting example with 111

If a rotating body floating above a shaft by means of a bearing (an idler pulley, guide roller, or the like) has an armature type-3 mounted on it directly, it can be assembled easily without taking up a lot of space.

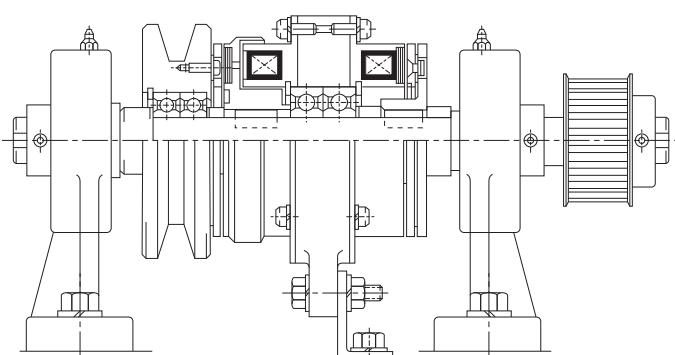

Air gap "a" can be set easily using collars and shims.

Corrections are easily accomplished by adding or removing shims.

Example of combining clutches and brakes

In this example, a clutch and brake are assembled on a through-shaft. This is effective when mounting space is limited or when there is no wall on which to mount the stator.

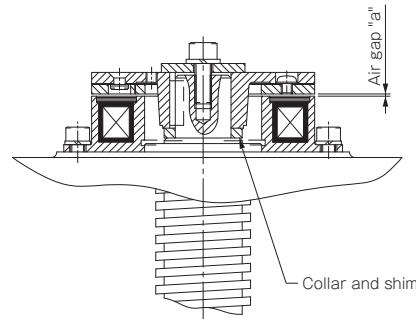

Armature type-2 mounting example on vertical shaft with 111

Armature type-2 is a special armature that puts the boss part of the armature hub into the space within the stator. That makes it compact. It is short in the axial direction even when a pulley or the like is installed on the tip of the brake. Since running torque is zero, it does not take up space even when mounted on a vertical shaft, and is also easy to install.

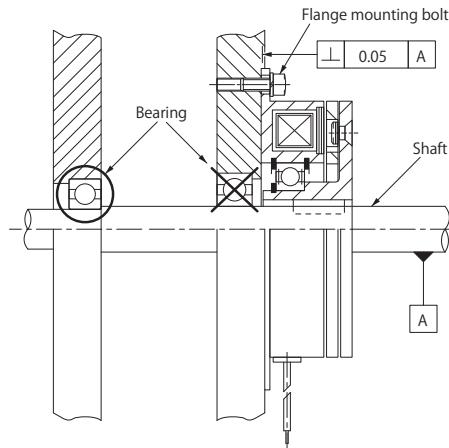

Air gap "a" can be set easily using collars and shims.

Corrections are easily accomplished by adding or removing shims.

Mounting example with BSZ

Simply insert onto the shaft to be braked and lock the BSZ on the wall surface and mounting is complete. Be careful when designing that the mounting shaft does not cantilever and end up a three-point mounting.
